

Can solar panels generate electricity when laid flat

Overview

Can solar panels be installed flat?

Yes, you can install solar panels flat, but they will experience a degree of energy loss without the slightest inclination towards the sunlight. Although it certainly is advantageous to have a roof that is inclined in the sun's direction, a flat surface will also do.

Why do solar panels need to be laid flat?

When laid flat, they don't capture as much sunlight as panels on a sloped roof or pitched roofs. This can result in less electricity generated throughout the day, especially in areas where the sun's angle changes significantly. Adjusting the panel's angle can improve how solar panels work by maximizing sunlight exposure.

How do solar panels generate the most electricity?

The most important factor in generating the most electricity possible is the angle at which the panels are mounted. This is because a solar panel tilted towards the sun will capture more energy than one laid flat. A solar panel laid flat will have a 'tilt angle' of 0 degrees. Even small increments from this can have a dramatic effect output.

Can a flat PV system fit more solar panels?

US-based energy technology developer, Erthos, is a clear example of a company investing heavily in flat PV panels. They have obtained a patent for an 'Earth Mount Solar PV system' which the company says can fit more panels into a space than conventional utility-scale plants. So are these companies on to something interesting?
