

# **Does 6G communication require base stations**

## Overview

---

Why do we need a 6g network?

The 5G experience has shown that complex core networks, large numbers of base stations, and a single form factor base station lead to high costs and management difficulties that significantly constrain network evolution. Therefore, in 6G design, it is necessary to sort out these issues and create a more simplified system.

What are the 4 parts of a 6g network?

The 6G network architecture includes four parts: space-based networks, aerial networks, ground-based networks, and maritime networks. The space network consists of diverse types of satellites, constellations, and the corresponding ground infrastructures, including the ground stations and the control centers.

What is a 6g network architecture?

Displays an integrated network architecture for space-aerial-ground-sea network The 6G network architecture includes four parts: space-based networks, aerial networks, ground-based networks, and maritime networks.

Will 6G networks be AI-native?

6G networks will be AI-native. This means AI will be a core component embedded at every network layer, not an add-on. AI algorithms will autonomously handle real-time resource allocation, interference management, security threat detection, and network optimization.
