

Gel batteries suitable for energy storage

Overview

Sealed gel batteries are a type of lead-acid battery that uses a gel electrolyte, making them ideal for energy storage and solar applications. Are gel batteries good for solar panels?

Gel batteries are one of the most popular and reliable options in solar energy systems. These types of batteries, which use an electrolyte in gel form instead of liquid, have gained ground in solar applications due to their unique characteristics that make them suitable for storing electricity generated by solar panels. What are gel batteries?

.

What is a gel battery?

Gel batteries are a type of rechargeable battery that uses an electrolyte in gel form instead of liquid. This gel is composed of sulfuric acid, water and silica, and is thicker than the liquid electrolyte used in conventional lead-acid batteries. The gel acts as a medium to transport electrical charges between the battery's electrodes.

Why should you choose a gel battery?

Gel batteries are sealed and airtight, significantly reducing the risk of corrosive acid leaks. This makes them safer and easier to handle, without the need for regular maintenance, such as adding distilled water, which is common with conventional lead-acid batteries. No maintenance reduces costs over the life of the battery. 3. Vibration resistant.

Are gel batteries safe?

Because they are “sealed,” gel batteries don’t need their water levels checked and monitored like standard lead-acid options, nor do they expel gas. These factors generally make gel batteries safer than traditional lead-acid options, as they’re more of a “set it and forget it” product.
