

Inverter adjustment voltage range

Overview

What are inverter settings?

Inverter Settings 1. To set output voltage of inverter - This is normally 230 Vac. Possible values 210V ~ 245V. 2. Used to enable/disable the internal ground relay functionality. Connection between N and PE during inverter operation. - The ground relay is useful when an earth-leakage circuit-breaker is part of the installation.

What are reactive power capabilities of inverters?

The reactive power capabilities of inverters can be used to maintain the voltage within the limits. The voltage related control mode Q(U) controls the reactive power output as a function of the voltage.

Do goodwe inverters support a power limit function?

GoodWe inverters support both output and export power limit function. Installers can limit the inverter output to meet some special requirements. For example, many Australian homes are not allowed to export more than 5 kW to the grid. Therefore, the output limit is necessary for the system with an inverter larger than 5kW.

What happens if you hook up an inverter incorrectly?

It's incredibly important to ensure that a correct connection to the local grid is built. Hook up one part of the process incorrectly, the power of the inverter may not be allowed to feed in the local grid, or energy production will be lost, even money in a matter of seconds.
