Solar energy is the sun shining on solar panels

Overview

Do solar panels work if it's cloudy?

Your solar panels still work even when it's cloudy. Solar energy is one of the most accessible and cleanest forms of energy we have. We can tap the sun's power using solar panels, and turn the free sunlight into electricity to power our homes and more. However, solar energy isn't a topic that everybody is well-informed about.

How do solar panels work?

Light behaves as both a wave and a particle—a duality that forms the basis for how solar panels work. Each “particle” of light, known as a photon, carries a discrete amount of energy determined by its frequency, and when these photons strike certain materials, they can release electrons—a principle at the core of solar power.

What happens when sunlight strikes a solar panel?

When sunlight strikes a solar panel, it excites electrons within the solar cells, generating an electric current. Solar panels are made of semiconductor materials, typically silicon. These materials have unique properties that allow them to absorb sunlight and generate an electrical charge. 1. Solar Cells (Photovoltaic Cells).

How do solar panels produce electricity?

Solar panels absorb sunlight through their photovoltaic cells. The energy from the sun excites electrons within the semiconductor material. The movement of excited electrons generates a flow of electricity, producing direct current (DC) power.
