Solar glass scale standard

Overview

What is a standard glass scale?

Standard glass scale is just like a kind of very precise ruler, and on its surface, accurate divisions are equally marked. You may measure the length by counting its divisions. The scale is frequently used, and even built in precise instruments, machining tools as length measuring standard scale.

What is a solar glass substrate?

Manufacturers of crystalline silicon solar modules apply glass substrates on the front side of the solar modules. This front glass will either be a patterned glass or a glass with anti-reflective coating (AR). As in all other glass manufacturing processes, solar glass substrates are subject to defects during production.

What is the standard temperature of Shibuya standard glass scale?

Besides, Shibuya has its own specially designed unique ones. Shibuya Standard Glass Scale's standard temperature of measuring length should be fixed at 23 °C, that is most common environment in workshops of Japanese manufacturer. For further detailed information, please contact with us first.

Why is patterned glass used in crystalline solar modules?

In the production of crystalline solar modules patterned glass substrates are used in lieu of bare glass. Patterned glass increases the amount of incoming sunlight. Common optical inspection systems for quality assurance and process control are mostly designed for unstructured glass.
