## Overview

---

What is uninterruptible power supply (UPS)?

Uninterruptible Power Supplies (UPS) have reached a mature level by providing clean and uninterruptible power to the sensitive loads in all grid conditions. Generally UPS system provides regulated sinusoidal output voltage, with low total harmonics distortion (THD), and high input power factor irrespective of the changes in the grid voltage.

What happens if a UPS system fails?

As long as grid power is available, a UPS system provides stable voltage output and stores supplementary power to keep devices running smoothly. UPS failures can spell disaster for businesses relying on this backup power source to protect critical data.

What is an ups & how does it work?

UPS, short for Uninterruptible Power Supply, is a power solution designed to ensure that electrical equipment such as computers can continue to operate during power surges or outages. It safeguards connected devices from the adverse effects of power interruptions, preventing data loss and potential damage to sensitive equipment.

Why do you need an UPS system?

It safeguards connected devices from the adverse effects of power interruptions, preventing data loss and potential damage to sensitive equipment. As long as grid power is available, a UPS system provides stable voltage output and stores supplementary power to keep devices running smoothly.
