

# There is a difference in voltage between the two groups of solar panels

## Overview

What is the difference between voltage and current for solar panels?

**Maximum Power Voltage (Vmp):** This is the voltage at which your panel operates most efficiently. If voltage is pressure, current (measured in amps) is the flow rate. Voltage is how steep the river is, while current is how much water flows past you each second. Some key points about current for solar panels:.

How many volts does a solar panel have?

If you have 5 panels with 12 volts each, the total voltage is 60 volts. The current remains the same as the individual panels. This series connection is ideal when the goal is a higher system voltage, such as for grid-tied applications. Series-connected solar panels are great for not shade conditions and/or if you need a low-current system.

What is the difference between series and parallel solar panels?

The output voltage of a series-connected solar panel adds up, while the output current (amperage) remains constant. On the other hand, solar panels connected in parallel will have an increased output current (increased amperage), but their output voltage will be the same.

What are the characteristics of a solar panel?

These are current and voltage. As previously mentioned, when we connect solar panels in series, the voltage gets added up. When we wire multiple solar panels in parallel, the current gets added up. Now, how can we use these characteristics to our advantage when we are mixing solar panels?
