

# UK capacitor energy storage project

## Overview

---

With a total capacity of 680MW / 1360MWh, Carrington is one of the UK's largest single-site battery storage projects to reach financial close, marking a decisive step toward a highly renewable, flexible, and intelligent power system that enhances grid resilience and supports the country's low-carbon transition. What are energy storage capacitors?

Energy storage capacitors are electronic components that can store electrical energy. They are typically found in remote or battery powered applications and can be used to deliver peak power, reducing depth of discharge on batteries, or provide hold-up energy for memory read/write during an unexpected shut-off.

Can large-scale battery storage be a key enabler of energy transition?

The project brings together leading stakeholders including Statera Energy, Lloyds, Statkraft, NatWest, Santander, Siemens Bank, SEB, and Mizuho, highlighting strong institutional confidence in large-scale battery storage as a core enabler of the energy transition.

What is Carrington battery storage?

With a total capacity of 680MW / 1360MWh, Carrington is one of the UK's largest single-site battery storage projects to reach financial close, marking a decisive step toward a highly renewable, flexible, and intelligent power system that enhances grid resilience and supports the country's low-carbon transition.

When will Carrington storage be energised?

Located at Trafford Low Carbon Energy Park in Greater Manchester, Carrington Storage is expected to be energised by late 2026. Once operational, it will deliver power to around 2.2 million homes for up to two hours, enhancing grid stability, reducing renewable curtailment, and supporting the UK's net-zero and energy security goals.
