# Uninterruptible power supply over-temperature protection module

## Overview

---

Why do power management chips need over-temperature protection?

Power management chips are damaged to varying degrees when they work at the ambient temperature beyond their acceptable range, and the over-temperature protection circuit plays an important role in improving the reliability and robustness of this kind of chip.

What are the different types of over temperature protection circuit?

This work introduces and compares four types of over temperature protection circuit in 0.25  $\mu\text{m}$  BCD technology. The core temperature detection circuit of the four types are formed by a single BJT, double BJT, double MOSFET, BJT and MOSFET, respectively.

Why do power converters need temperature protection?

In order to protect the power converter and the back-end circuits, temperature protection is necessary in the design. Over Temperature Protection (OTP) is used to prevent the power converter to avoid operating continuously over temperature condition and then cause component damage.

Can a programmable temperature switch IC improve over-temperature protection?

This article implements an over-temperature protection experiment, using a programmable temperature switch IC to reduce the complexity of circuit design and improve functionality, and finally combine with a power converter to realize the over-temperature protection function.
