

Ups inverter changes input voltage

Overview

What is a ups inverter?

The inverter in the UPS system is between the rectifier and static switch and is the core part of the UPS device. The main role of the inverter is to convert the rectifier or battery output DC power into 50Hz AC power, send it to the static switch, and finally supply it to the load equipment.

How does a 4 level inverter based ups work?

Four-level inverter based UPS typically develop a switching voltage of 250 V across IGBTs which results in lower switching losses. However, conduction losses also proportionally increase with increased number of active components. These increased conduction losses can be compensated by the reduction of switching & filter losses.

How many inverters are used in ups?

Currently, there are only three topologies namely, two-level, three-level, and four-level inverters are employed for UPS applications. The performance of each topology with respect to the key technical parameters is described in the table on next page.

Why is a three-level inverter NOT widely implemented for UPS applications?

Therefore, this topology is not yet widely implemented for UPS applications due to its circuit complexity and control challenges. Currently, there are only three topologies namely, two-level, three-level, and four-level inverters are employed for UPS applications.
