

Use 24v with 48v inverter

Overview

The inverter is designed to operate at 24 volts, and connecting it to a 48V source can lead to overvoltage, potentially damaging both the inverter and the connected devices. Can a 24V inverter run a 48v battery?

Explore the basics of using a 24V inverter on a 48V battery setup to understand its compatibility and potential advantages and disadvantages:
Inverter Functionality: Inverters convert DC power from batteries into AC power, crucial for running household devices off-grid or during power outages.

Do 48V power inverters work?

48V power inverters work perfectly in 48V solar systems, which are usually either small commercial or large residential. These inverters are typically paired with 48V PV modules and batteries of a comparable voltage.

Is a 24V inverter better than a 48V?

At 48V it drops to a more reasonable 66A. This is actually better than you might think because power loss is proportional to current squared, so if you use your existing wiring and connectors the loss in them will be 4 times higher. A 24V inverter might be a bit cheaper, but you should consider the cost of replacing your wiring and fuses etc.

How much power does a 24V inverter consume?

A good sized 24V inverter could use about as much power just being on as your lights do. If the lights consume 45 watts and run for 12 hours a day, the total power usage would be 45 watts x 12 hours = 540 watts. The battery power required for losses plus the load could double that. The lights themselves may be DC, using a small transformer (wall wart) to go from 120Vac to (likely) 12Vdc.
