

# What is the water temperature of the liquid cooling energy storage cabinet

## Overview

---

How hot is water in a liquid cooled system?

According to Uptime, water temperatures in liquid-cooled systems today seem to be converging around 32°C (89.6°F) for facility water - what is described as a “good balance” between facility efficiency, cooling capacity, and support for a wide range of DLC systems.

Can liquid cooling system reduce peak temperature and temperature inconsistency?

The simulation results show that the liquid cooling system can significantly reduce the peak temperature and temperature inconsistency in the ESS; the ambient temperature and coolant flow rate of the liquid cooling system are found to have important influence on the ESS thermal behavior.

Why does air cooling lag along in energy storage systems?

Abstract: With the energy density increase of energy storage systems (ESSs), air cooling, as a traditional cooling method, limps along due to low efficiency in heat dissipation and inability in maintaining cell temperature consistency. Liquid cooling is coming downstage.

Is water a core part of a data center cooling system?

Water is a core part of many data center cooling systems. But as densities - and therefore temperatures - increase, questions need to be asked about the right temperatures of the water cooling these systems.
